

Environmental Policy

Business is a huge social responsibility, which only gives full satisfaction when you feel you exercise full control over every area of your business. JIT Logistik is an Organization with a strong identity, with tasks and responsibilities tailored to our ambitions and clearly defined goals. We would not experience the feeling of a job well done without a permanent concern for the environment built into every aspect of our operations. We are conscious citizens of our Planet, so we feel fully responsible for it both on personal and professional grounds. The type of services we provide means that protecting our “green home” that is the Earth is not just a symptom of our responsibility, it is our duty.

This Policy is a code of conduct and, at the same time, a strategic plan to ensure the operation and further development of our Organization in accordance with legislation, national guidelines, international guidelines and corporate social organization.

Principle of environmental responsibility. We want us as an Organization, but also as people, to take care of nature in every possible way, so we recommend taking care of nature in our private lives, in our workplace individually, and then as a team. Our activities can be seen not only in common spaces, but also in single-person offices.

Prevention principle. We all agree with the statement that prevention is better than cure, so our action is characterized by preventive, testing action, supported by analysis, confirming the effectiveness of protection or positive environmental impact before taking final solutions.

The principle of cooperation. We promote the need and obligation to act in an environmentally friendly manner in the Organization, so that everyone is aware of the rightness of our activities, and thus we increase our perception and area of change. Together we can do more. Every employee can influence the introduction of more environmentally friendly solutions or products. The development of processes by people dealing with different tasks in the Organization allows the development of a solution that is more complete, more useful and more in tune with the need to protect the environment.

Consistency principle. It is important that every department of the Organization recognizes the need and works to protect the environment. The objectives of each area must be consistent and fit into the Organization's unified policy for environmental protection.

Substitution principle. With each person seeing the need to protect the environment, habits, previous actions are more likely to be replaced by new, more effective, better practices with less or no negative effect on nature.

We strive to implement our environmentally supportive measures permanently, without delay, while involving employees and partners, so that our good practices have an impact on JIT Logistik, as well as our local and business environment.

JIT Logistik's impact and commitments to the environment

At JIT Logistik, we are aware that transportation, along with air emissions resulting from fuel combustion, exerts the biggest environmental impact. At JIT Logistik, we only have vehicles with EURO5 and EURO6 emission standards.

We conduct environmental impact monitoring and take measures to reduce environmental impacts, particularly those related to fuel combustion during transportation, including CO₂ emissions.

In order to ensure minimal impact on the environment (management of chemical substances, proper waste management) during vehicle inspections and repairs, these activities are performed at professional authorized service stations.

At JIT Logistik, we work with transportation partners who take a responsible approach to environmental issues and use cars with EURO5 and higher emission standards.

In office work, we want to reduce energy and water consumption being aware that even the smallest actions contribute to environmental protection.

JIT Logistik undertakes to comply with legal requirements.

JIT Logistik undertakes to improve the effectiveness of the environmental management system.
